**STATEMENT CLAIMING SMALL ENTITY STATUS
(37 CFR 1.9(f) & 1.27(b))--INDEPENDENT INVENTOR**

Docket Number (Optional)

Applicant, Patentee, or Identifier:

Wayne Harrison Robinson

Application or Patent No.:

Filed or Issued:

7/12/2000

Title:

Kenny Clamp

As a below named inventor, I hereby state that I qualify as an independent inventor as defined in 37 CFR 1.9(c) for purposes of paying reduced fees to the Patent and Trademark Office described in:

- ☐ the specification filed herewith with title as listed above.
☒ the application identified above.
☐ the patent identified above.

I have not assigned, granted, conveyed, or licensed, and am under no obligation under contract or law to assign, grant, convey, or license, any rights in the invention to any person who would not qualify as an independent inventor under 37 CFR 1.9(c) if that person had made the invention, or to any concern which would not qualify as a small business concern under 37 CFR 1.9(d) or a nonprofit organization under 37 CFR 1.9(e).

Each person, concern, or organization to which I have assigned, granted, conveyed, or licensed or am under an obligation under contract or law to assign, grant, convey, or license any rights in the invention is listed below:

- ☒ No such person, concern, or organization exists.
☐ Each such person, concern, or organization is listed below.

Separate statements are required from each named person, concern, or organization having rights to the invention stating their status as small entities. (37 CFR 1.27)

I acknowledge the duty to file, in this application or patent, notification of any change in status resulting in loss of entitlement to small entity status prior to paying, or at the time of paying, the earliest of the issue fee or any maintenance fee due after the date on which status as a small entity is no longer appropriate. (37 CFR 1.28(b))

Applicant believes that there was error in that Claim 1 defined his invention too narrowly. Subsequently new Claim 7 and dependent Claims 8-14 have been added to broaden the scope of the invention. Basis for these Claims can be found in Fig.2 and page 3 of the specification under Detailed Description of the Invention.

The Reissue oath fully complies with C.F.R. 1.63.

Respectfully Submitted;

By: Robert Halper- Reg.No. 30,536

Attorney for Applicant

THE KENNY CLAMP

Field of Invention

This invention pertains to a clamp, described as a "Kenny Clamp" whose function it is to bond the grounding electrode conductor to the enclosure of an electric service box, an auxiliary gutter or other related service equipment in accordance with the requirements of the 1996 National Electric Code and is particularly useful in household wiring.

Background of the Invention

Typically the grounding electrode conductor is fastened to a water pipe or made electrode and extends through an outlet in a service box where it is fastened to a bus bar with a screw.

Exemplary pf prior art ground connectors are as follows:

U.S. Pat. 2,710,381 teaches a device for bonding an electric ground wire to an electric outlet or switch box. This apparatus employs a grounding coupling or wedge wherein the electric wire to be connected to the box is placed in a groove and a stud screwed down upon it. A pin having contact with the ground wire also makes contact with the electric outlet box.

U.S. Pat. 3,009,128 teaches a coupling nut provided with a terminal connector for use in grounding equipment(not specified). The problem that was solved encompassed making the coupling nuts accessible. Heretofore the coupling nut was attached to the terminal in such a way that after it was in place, the terminal connector was inaccessible or very difficult to access. In the invention the coupling nut is cylindrical, has internal threads for threading to a conduit that projects into a service box. A terminal is mounted outside the fitting and has an opening through which a ground wire from equipment within the box can enter either way, and then a set screw is placed down on the wire either radially or axially.

U.S. Pat. 3,567,843 teaches an electric connector for attaching a waterproof jacketed armored cable to a junction box. The cable is rigidly gripped by the connector, which comprises a resilient grommet surrounding the jacket which is compressed between two threaded members. Stirrups straddle the inner and outer surfaces of the grommet at one end and contact both an exposed metal part of the cable and the connector to provide electric grounding. The connector is also provided with a section extending from the gripping surfaces to thread into the junction box.

U.S. Pat. 4,496,791 shows a spring biased connector for electrically bonding a device to a supporting wall. A flanged bushing is threaded into a push button housing mounted on a metal wall. A serrated spring is located between the flange of the bushing and the metal wall so that when the threaded fastener engages the bushing the spring is deflected into the wall and completes an electric circuit. This type of arrangement obviates use of a ground connection wire.

U.S. Pat. 5,181,860 teaches a plug and receptacle connector that is to be used on the control box of a machine tool, etc. An earth lug when mounted in an insulator causes a spring piece of the lug to pierce into a chromate film on a galvanized layer of a receptacle shell resulting in conductivity.

conventional electrical connector in the panel board

Fig. 2 is a front section showing the assembly of the grounding electrode conductor to the improved electrical connector of the invention in the panel board.

Fig. 3 is an enlarged view of the improved connector and a mechanism for fastening of the connector to the conductor.

Fig. 4a is an enlarged view of another embodiment showing another connector.

Fig. 4b is a view showing the connector secured to the panel board.

Fig. 5a is an enlarged view of a third embodiment of a connector.

Fig. 5b is a similar view to Fig. 4b showing the third embodiment secured to the panel board.

Detailed description of the Preferred Embodiment

Fig 1 shows the grounding electrode conductor 1 conventionally connected to a water pipe 2, the grounding electrode, and extending to an inlet 3 of a panel board 4. The conventional connector 5 consists of adjacent plates 6a, 6b through which conductor 1 passes. These plates contain spaced threaded perforations 7 through which pass screws 8 to secure the conductor 1 to the plates. One of the plates is welded to a bushing 8a that threads into an opening 9 in the panel board. The conductor 1 terminates in a bus bar 10 where it is secured by screw 11.

Fig. 2 shows the grounding electrode conductor 1 assembled as in Figure 1 except for the improved connector 12. The inlet 13 is now of a size to accommodate a high press cylindrical sleeve 14, which is either 1/2" or 3/4" and is made of copper or aluminum. For a 1/2" sleeve a #8 through #2 bare copper conductor, or a #6 through 1 bare aluminum would be used. For a 3/4 " sleeve, a #1 through 3/0 bare copper/aluminum conductor, or a #1 through bare aluminum would be used. The portion of the sleeve that enters the panel board is threaded and secured [therto] thereto by a lock nut 15. The conductor passes through the sleeve and as in Figure 2 ends in the bus bar 10 within the panel board, where it is secured by the screw 11. .The conductor 1 is clamped in the sleeve by crimping the sleeve as shown at 12a [As shown in] In Figure 3, a long handled plier 16 having arms 16a, wherein one arm has a projecting tooth 17a and the other arm has a corresponding groove 17b. The plier grasps the sleeve at several positions on its outer surface to compress the sleeve around the conductor. A second method shown in Figure 4 involves shaping the sleeve as a funnel 18 wherein the narrow portion of the funnel is slit into two legs 19. which are threaded the length of the funnel. Beyond the funnel there is a cylindrical threaded extension 20 that is fastened to the panel board and secured by a lock nut 21 adjacent the interior of the panel board. A threaded ring 22, having a diameter corresponding to the diameter of the narrow portion of the funnel, is slipped over the legs..As it is turned upward, it compresses the legs around the conductor.A flange 23 on the extension adjacent the exterior surface of the panel board limits the movement of the ring. While this is the preferred device used to clamp the conductor, a slight modification is shown in Figure 5a. The narrow portion of the funnel is divided into four legs.This modification is more appropriate where the grounding electrode conductor is of a larger diameter. In any case whichever device is used, both the

While the invention has been shown and described in terms of specific embodiments, it will be obvious to those skilled in the art that various modifications and changes can be made therein without departing from the scope and spirit of the invention.

[illegible]

a) a grounding electrode having a grounding electrode conductor affixed thereto, said conductor extending from said grounding electrode to an electrical panel board,

c) compression means for clamping and securing said grounding electrode conductor to said metal press sleeve in electrical contact at the region of clamping.

e) said press sleeve and said grounding electrode conductor being rated for available fault current.

3. A grounding electrode conductor wherein said connector and said conductor are made of copper.

5. A grounding electrode conductor as in Claim 1 wherein said sleeve is in the form of a funnel having a lower, bifurcated, narrow end and a wider upper end having a cylindrical extension that threads into said inlet of said panel board, said funnel having a threaded exterior surface said compression means includes a threaded ring having an internal diameter corresponding to that of said bifurcated narrow end, said ring being rotated so as to compress said bifurcated ends of said funnel around said conductor.

6. A grounding electrode conductor as in Claim 5 wherein said lower end of said funnel is divided

2025

8. A device for bonding a grounding electrode conductor to the enclosure of an electric service box in conformance to the National Elecreic Code comprising

b) said enclosure having an inlet to which a metal press sleeve conector can be affixed, said connector having a top and bottom with an aperture thereat for receiving said conductor, said top of said connector being threaded and secured to said inlet by a lock nut, said conductor having an end that passes through said aperture in said top and being fastened to a bus bar in said enclosure.

d) said sleeve being substantially in the form of a cylinder having a threaded extension that passes through said inlet of said enclosure, said compression means includes a long handled plier having one toothed arm and another arm having a corresponding groove, said plier grasping said sleeve at spaced sections thereof to crimp said sleeve

9. A device as In Claim 8 wherein said connector and said conductor are made from a metal selected from copper and aluminum.

11. wherein said sleeve has a diameter of 1/2" or 3/4" said conductor has a dimension within the range of #8-#2 for a 1/2" sleeve and within the range of #1-3/0 for a 3/4" sleeve.
